

# **RPS-1000 / RPS-1000B**

Intelligent Power Module

**Installation and Operation Guide**

# Fire Alarm & Emergency Communication System Limitations

*While a life safety system may lower insurance rates, it is not a substitute for life and property insurance!*

**An automatic fire alarm system**—typically made up of smoke detectors, heat detectors, manual pull stations, audible warning devices, and a fire alarm control panel (FACP) with remote notification capability—can provide early warning of a developing fire. Such a system, however, does not assure protection against property damage or loss of life resulting from a fire.

**An emergency communication system**—typically made up of an automatic fire alarm system (as described above) and a life safety communication system that may include an autonomous control unit (ACU), local operating console (LOC), voice communication, and other various interoperable communication methods—can broadcast a mass notification message. Such a system, however, does not assure protection against property damage or loss of life resulting from a fire or life safety event.

The Manufacturer recommends that smoke and/or heat detectors be located throughout a protected premises following the recommendations of the current edition of the National Fire Protection Association Standard 72 (NFPA 72), manufacturer's recommendations, State and local codes, and the recommendations contained in the Guide for Proper Use of System Smoke Detectors, which is made available at no charge to all installing dealers. This document can be found at <http://www.systemsensor.com/appguides/>. A study by the Federal Emergency Management Agency (an agency of the United States government) indicated that smoke detectors may not go off in as many as 35% of all fires. While fire alarm systems are designed to provide early warning against fire, they do not guarantee warning or protection against fire. A fire alarm system may not provide timely or adequate warning, or simply may not function, for a variety of reasons:

**Smoke detectors** may not sense fire where smoke cannot reach the detectors such as in chimneys, in or behind walls, on roofs, or on the other side of closed doors. Smoke detectors also may not sense a fire on another level or floor of a building. A second-floor detector, for example, may not sense a first-floor or basement fire.

**Particles of combustion or "smoke"** from a developing fire may not reach the sensing chambers of smoke detectors because:

- Barriers such as closed or partially closed doors, walls, chimneys, even wet or humid areas may inhibit particle or smoke flow.
- Smoke particles may become "cold," stratify, and not reach the ceiling or upper walls where detectors are located.
- Smoke particles may be blown away from detectors by air outlets, such as air conditioning vents.
- Smoke particles may be drawn into air returns before reaching the detector.

The amount of "smoke" present may be insufficient to alarm smoke detectors. Smoke detectors are designed to alarm at various levels of smoke density. If such density levels are not created by a developing fire at the location of detectors, the detectors will not go into alarm.

Smoke detectors, even when working properly, have sensing limitations. Detectors that have photoelectronic sensing chambers tend to detect smoldering fires better than flaming fires, which have little visible smoke. Detectors that have ionizing-type sensing chambers tend to detect fast-flaming fires better than smoldering fires.

Because fires develop in different ways and are often unpredictable in their growth, neither type of detector is necessarily best and a given type of detector may not provide adequate warning of a fire.

Smoke detectors cannot be expected to provide adequate warning of fires caused by arson, children playing with matches (especially in bedrooms), smoking in bed, and violent explosions (caused by escaping gas, improper storage of flammable materials, etc.).

**Heat detectors** do not sense particles of combustion and alarm only when heat on their sensors increases at a predetermined rate or reaches a predetermined level. Rate-of-rise heat detectors may be subject to reduced sensitivity over time. For this reason, the rate-of-rise feature of each detector should be tested at least once per year by a qualified fire protection specialist. Heat detectors are designed to protect property, not life.

**IMPORTANT! Smoke detectors** must be installed in the same room as the control panel and in rooms used by the system for the connection of alarm transmission wiring, communications, signaling, and/or power. If detectors are not so located, a developing fire may damage the alarm system, compromising its ability to report a fire.

**Audible warning devices such as bells, horns, strobes, speakers and displays** may not alert people if these devices are located on the other side of closed or partly open doors or are located on another floor of a building. Any warning device may fail to alert people with a disability or those who have recently consumed drugs, alcohol, or medication. Please note that:

- An emergency communication system may take priority over a fire alarm system in the event of a life safety emergency.
- Voice messaging systems must be designed to meet intelligibility requirements as defined by NFPA, local codes, and Authorities Having Jurisdiction (AHJ).
- Language and instructional requirements must be clearly disseminated on any local displays.
- Strobes can, under certain circumstances, cause seizures in people with conditions such as epilepsy.
- Studies have shown that certain people, even when they hear a fire alarm signal, do not respond to or comprehend the meaning of the signal. Audible devices, such as horns and bells, can have different tonal patterns and frequencies. It is the property owner's responsibility to conduct fire drills and other training exercises to make people aware of fire alarm signals and instruct them on the proper reaction to alarm signals.
- In rare instances, the sounding of a warning device can cause temporary or permanent hearing loss.

**A life safety system** will not operate without any electrical power. If AC power fails, the system will operate from standby batteries only for a specified time and only if the batteries have been properly maintained and replaced regularly.

**Equipment used in the system** may not be technically compatible with the control panel. It is essential to use only equipment listed for service with your control panel.

**Telephone lines** needed to transmit alarm signals from a premises to a central monitoring station may be out of service or temporarily disabled. For added protection against telephone line failure, backup radio transmission systems are recommended.

**The most common cause** of life safety system malfunction is inadequate maintenance. To keep the entire life safety system in excellent working order, ongoing maintenance is required per the manufacturer's recommendations, and UL and NFPA standards. At a minimum, the requirements of NFPA 72 shall be followed. Environments with large amounts of dust, dirt, or high air velocity require more frequent maintenance. A maintenance agreement should be arranged through the local manufacturer's representative. Maintenance should be scheduled as required by National and/or local fire codes and should be performed by authorized professional life safety system installers only. Adequate written records of all inspections should be kept.

Limit-D2-2016

# Installation Precautions

*Adherence to the following will aid in problem-free installation with long-term reliability:*

**WARNING - Several different sources of power can be connected to the fire alarm control panel.** Disconnect all sources of power before servicing. Control unit and associated equipment may be damaged by removing and/or inserting cards, modules, or inter-connecting cables while the unit is energized. Do not attempt to install, service, or operate this unit until manuals are read and understood.

## **CAUTION - System Re-acceptance Test after Software**

**Changes:** To ensure proper system operation, this product must be tested in accordance with NFPA 72 after any programming operation or change in site-specific software. Re-acceptance testing is required after any change, addition or deletion of system components, or after any modification, repair or adjustment to system hardware or wiring. All components, circuits, system operations, or software functions known to be affected by a change must be 100% tested. In addition, to ensure that other operations are not inadvertently affected, at least 10% of initiating devices that are not directly affected by the change, up to a maximum of 50 devices, must also be tested and proper system operation verified.

**This system** meets NFPA requirements for operation at 0-49° C/ 32-120° F and at a relative humidity 93% ± 2% RH (noncondensing) at 32°C ± 2°C (90°F ± 3°F). However, the useful life of the system's standby batteries and the electronic components may be adversely affected by extreme temperature ranges and humidity. Therefore, it is recommended that this system and its peripherals be installed in an environment with a normal room temperature of 15-27° C/60-80° F.

**Verify that wire sizes are adequate** for all initiating and indicating device loops. Most devices cannot tolerate more than a 10% I.R. drop from the specified device voltage.

**Like all solid state electronic devices**, this system may operate erratically or can be damaged when subjected to lightning induced transients. Although no system is completely immune from lightning transients and interference, proper grounding will reduce susceptibility. Overhead or outside aerial wiring is not recommended, due to an increased susceptibility to nearby lightning strikes. Consult with the Technical Services Department if any problems are anticipated or encountered.

**Disconnect AC power and batteries** prior to removing or inserting circuit boards. Failure to do so can damage circuits.

**Remove all electronic assemblies** prior to any drilling, filing, reaming, or punching of the enclosure. When possible, make all cable entries from the sides or rear. Before making modifications, verify that they will not interfere with battery, transformer, or printed circuit board location.

**Do not tighten screw terminals** more than 9 in-lbs. Over-tightening may damage threads, resulting in reduced terminal contact pressure and difficulty with screw terminal removal.

**This system contains static-sensitive components.** Always ground yourself with a proper wrist strap before handling any circuits so that static charges are removed from the body. Use static suppressive packaging to protect electronic assemblies removed from the unit.

**Follow the instructions** in the installation, operating, and programming manuals. These instructions must be followed to avoid damage to the control panel and associated equipment. FACP operation and reliability depend upon proper installation.

Precau-D1-9-2005

## FCC Warning

**WARNING:** This equipment generates, uses, and can radiate radio frequency energy and if not installed and used in accordance with the instruction manual may cause interference to radio communications. It has been tested and found to comply with the limits for class A computing devices pursuant to Subpart B of Part 15 of FCC Rules, which is designed to provide reasonable protection against such interference when devices are operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference, in which case the user will be required to correct the interference at his or her own expense.

## Canadian Requirements

This digital apparatus does not exceed the Class A limits for radiation noise emissions from digital apparatus set out in the Radio Interference Regulations of the Canadian Department of Communications.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le Règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

## Software Downloads

In order to supply the latest features and functionality in fire alarm and life safety technology to our customers, we make frequent upgrades to the embedded software in our products. To ensure that you are installing and programming the latest features, we strongly recommend that you download the most current version of software for each product prior to commissioning any system. Contact Technical Support with any questions about software and the appropriate version for a specific application.

## Documentation Feedback

Your feedback helps us keep our documentation up-to-date and accurate. If you have any comments or suggestions about our online Help or printed manuals, you can email us.

Please include the following information:

- Product name and version number (if applicable)
- Printed manual or online Help
- Topic Title (for online Help)
- Page number (for printed manual)
- Brief description of content you think should be improved or corrected
- Your suggestion for how to correct/improve documentation

Send email messages to:

**FireSystems.TechPubs@honeywell.com**

Please note this email address is for documentation feedback only. If you have any technical issues, please contact Technical Services.

## Section 1: Overview

### 1.1 RPS-1000 Description

The RPS-1000 Intelligent Power Module provides additional power and circuits to the IFP-2100, IFP-2100ECS, IFP-2000, IFP-2000ECS, IFP-1000, IFP-1000ECS, IFP-300, IFP-300ECS, IFP-100, IFP-100ECS or IFP-75 FACP's. The RPS-1000 can power all the FACP compatible modules, including SLC devices (via a Model 5815XL or 6815 SLC Expander), remote annunciators, notification appliances, auxiliary power modules, and all other compatible modules. RPS-1000 is available in a black cabinet as P/N RPS-1000B\*

**NOTE:** The IFP-100 and IFP-75 do not use 5815XL or 6815 SLC expanders.

The RPS-1000 has six Flexputs™ and two programmable relays. Outputs are rated 3.0 A (6.0 A total for each RPS-1000). Relays are Form C rated at 2.5 A @ 24 VDC. Outputs and relays are fully programmable.

The RPS-1000 is optically isolated, providing ground loop isolation and transient protection. It functions as an SBUS repeater which conditions the RS-485 signal and allows the module to drive up to 6,000 feet of additional SBUS wiring.

The RPS-1000 is housed in a metal cabinet that is identical in size to the IFP-1000/IFP-1000ECS FACP cabinet. This cabinet is large enough to house two 17 AH batteries. The RPS-1000 cabinet provides mounting studs for two Model 5815XL or 6815 SLC Expander modules.

The RPS-1000 communicates to the main FACP via the SBUS. Each RPS-1000 provides an additional 6,000 feet of SBUS wiring length to the main panel. As the drawings on the next pages illustrate, this allows you to distribute modules, SLC devices, and outputs throughout an extremely large facility.

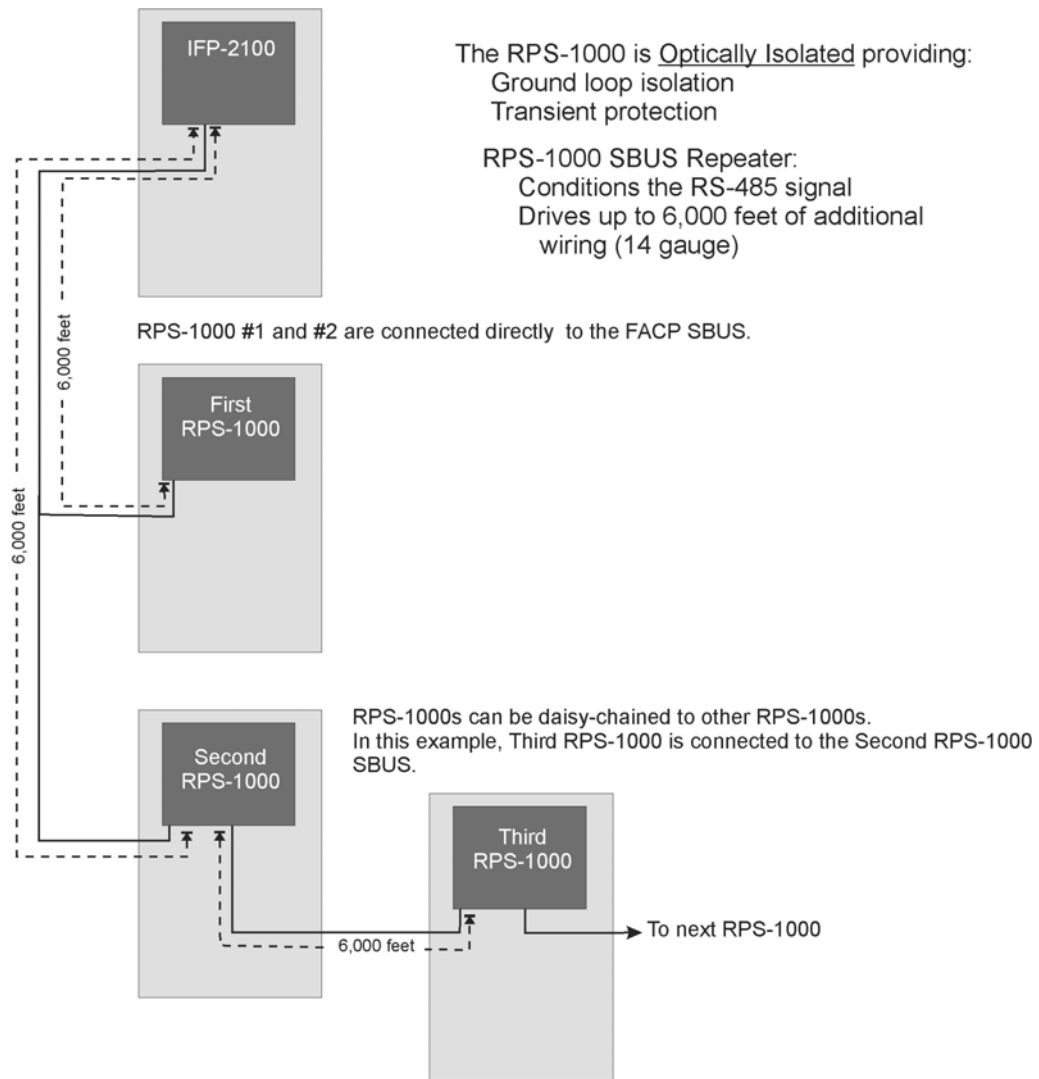

As well as expanding the wiring length capabilities of the FACP, the RPS-1000 also expands the power capabilities by an additional 6.0 A of current.

\* All references to RPS-1000 within this manual are applicable to the RPS-1000B.

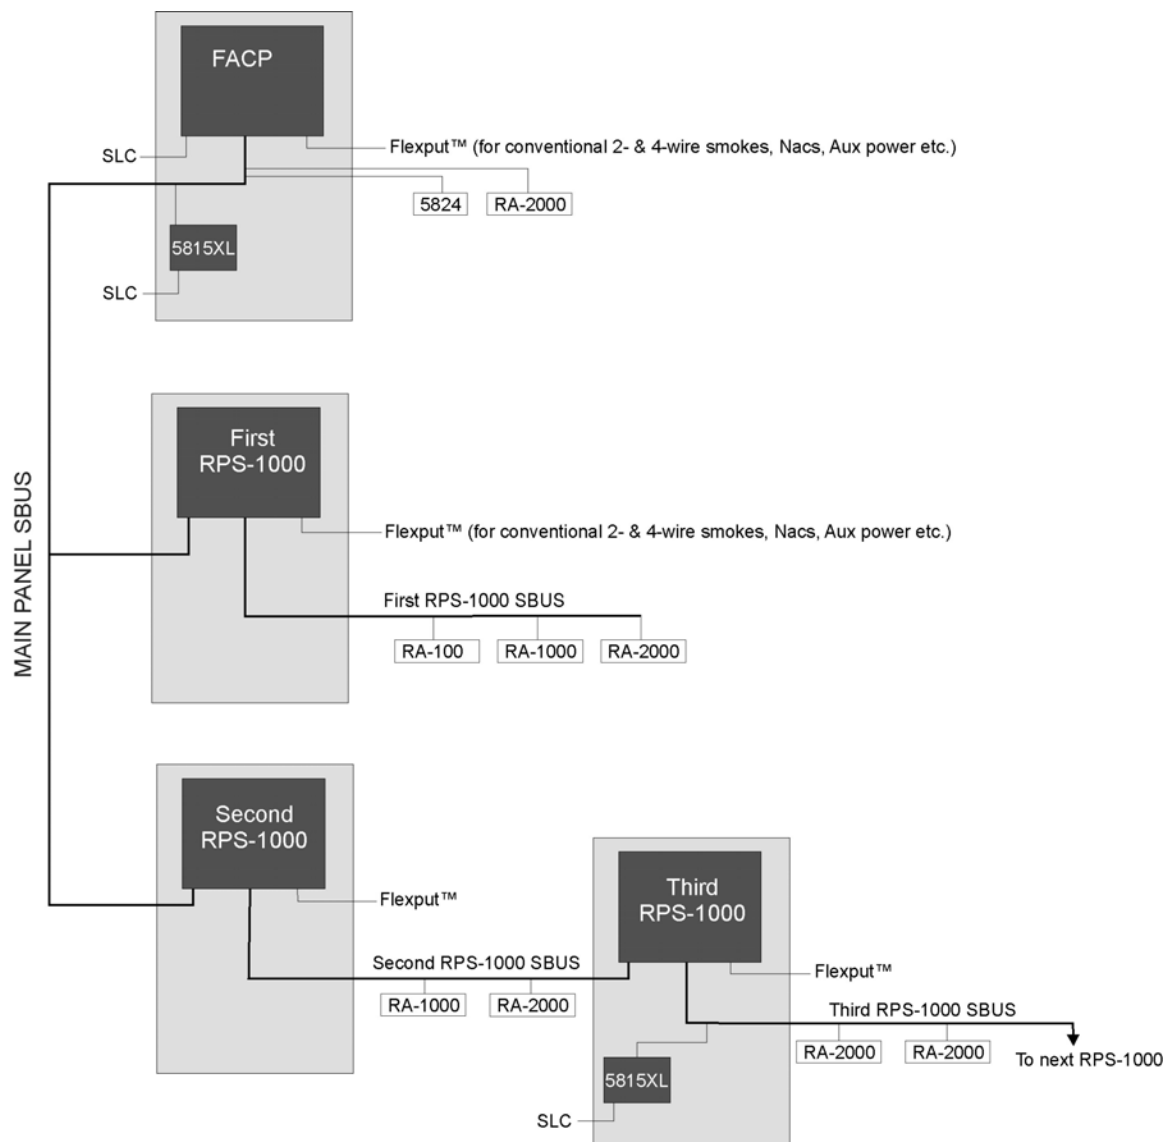

#### 1.1.1 Maximum Number of SBUS Modules

The chart below shows the maximum number of compatible modules that can be used in an Intelligent installation. Modules can be distributed among the main panel SBUS and each additional RPS-1000 SBUS in virtually any combination.

Module or Device	Maximum Number
RPS-1000/RPS-1000B Intelligent Power Module	8 per IFP-1000/ECS, IFP-100/ECS, IFP-50 or IFP-75 installation
	16 per IFP-300/ECS installation
	63 per IFP-2100/ECS or IFP-2000/ECS installation
RA-100 or RA-1000 Remote Annunciator	8 per IFP-50 or IFP-75 installation
	12 per IFP-100/ECS, IFP-1000/ECS installation
	16 per IFP-300/ECS installation
	31 per IFP-2100/ECS installation
RA-2000 Remote Annunciator	63 per IFP-2100/ECS or IFP-2000/ECS installation
6815 SLC Expander	63 per IFP-300/ECS or IFP-2100/ECS installation
5815XL SLC Expander	7 per IFP-1000/ECS installation
	63 per IFP-300/ECS, IFP-2000/ECS or IFP-2100/ECS installation
5824 Serial/Parallel Modules	4 per IFP-1000/ECS, IFP-300/ECS, IFP-2000/ECS or IFP-2100/ECS installation
Outputs	6 per IFP-1000 or IFP-1000ECS / RPS-1000
Conventional Relays	2 per IFP-1000 or IFP-1000ECS / RPS-1000

**Figure 1.1 Example RPS-1000 Installation Overview**

**Figure 1.2 Example RPS-1000 Installation Overview (Details Added)**

## 1.2 Agency Requirements

The RPS-1000 has the same requirements as the main control panel. These requirements are listed in:

ECS Series Model Number	FACP Installation Manual
IFP-2000ECS	151430-L8
IFP-1000ECS	151460
IFP-100ECS	151458
IFP-300ECS	LS10145-001SK-E
IFP-2100ECS	LS10143-001SK-E

## Section 2: Before You Begin Installing

### 2.1 Inventory

The Model RPS-1000 ships with the following hardware:

- A cabinet with all hardware assembled
- Two keys for the front door
- Ten 4.7K ohm end-of-line resistors

---

**NOTE:** For UL installations, 4.7k $\Omega$  end-of-line resistor (ordered separately) must be used.

---

- A battery cable for batteries wired in series

### 2.2 Environmental Specifications

It is important to protect the RPS-1000 control panel from water. To prevent water damage, the following conditions should be AVOIDED when installing the units:

- Do not mount directly on exterior walls, especially masonry walls (condensation)
- Do not mount directly on exterior walls below grade (condensation)
- Protect from plumbing leaks
- Protect from splash caused by sprinkler system inspection ports
- Do not mount in areas with humidity-generating equipment (such as dryers, production machinery)

When selecting a location to mount the RPS-1000, the unit should be mounted where it will NOT be exposed to temperatures outside the range of 0°C-49°C (32°F-120°F) or humidity outside the range of 10%-93% at 30°C (86°F) non-condensing.

### 2.3 Software Downloads

In order to supply the latest features and functionality in fire alarm and life safety technology to our customers, we make frequent upgrades to the embedded software in our products. To ensure that you are installing and programming the latest features, we strongly recommend that you download the most current version of software for each product prior to commissioning any system. Contact Technical Support with any questions about software and the appropriate version for a specific application. Software updates can be found at

## 2.4 RPS-1000 Board and Terminal Strip Description

Figure 2.1 on page 6 shows the RPS-1000 circuit board including location of terminals, the DIP switch for setting module ID, and the LED.

Figure 2.1 The RPS-1000 Board Layout

Table 2.1 Terminal Strip Description and Electrical Ratings

Terminal # and Label		Description	Rating	
			Voltage	Current
1	L	AC input (hot)	120/240 VAC, 50/60 Hz	2.7 A 1.4 A
2	G	Earth ground	N/A	N/A
3	N	AC input (neutral)	120/240 VAC, 50/60 Hz	2.7 A 1.4 A
4	X	I/O 6*	24 VDC	3.0 A Notification Circuits
5	O			100 mA Initiation Circuits
6	X	I/O 5*	24 VDC	3.0 A Notification Circuits
7	O			100 mA Initiation Circuits
8	X	I/O 4*	24 VDC	3.0 A Notification Circuits
9	O			100 mA Initiation Circuits

**Table 2.1 Terminal Strip Description and Electrical Ratings**

Terminal # and Label			Description	Rating	
				Voltage	Current
10	X	I/O 3*	Flexput™ Circuit	24 VDC	3.0 A Notification Circuits
11	O				100 mA Initiation Circuits
12	X	I/O 2*	Flexput™ Circuit	24 VDC	3.0 A Notification Circuits
13	O				100 mA Initiation Circuits
14	X	I/O 1*	Flexput™ Circuit	24 VDC	3.0 A Notification Circuits
15	O				100 mA Initiation Circuits
16	B	SBUS OUT	SBUS communication	5 VDC	100 mA

	22	+		0	0	-	-
	23	-		-	-	0	0

## 2.6 Calculating Current Draw and Standby Battery

This section is for helping you determine the current draw and standby battery needs for your installation.

### 2.6.1 Worksheet Requirements

The following steps must be taken when determining RPS-1000 current draw and standby battery requirements.

#### ■ Filling in the Current Draw Worksheet, Table 2.4, Table 2.5 or Table 2.6

- For the RPS-1000, the worst case current draw is listed for the panel, addressable devices, and SLC expanders. Fill in the number of addressable devices and expanders that will be used in the system and compute the current draw requirements for alarm and standby.
- Add up the current draw for all auxiliary devices and record in the table at Line B.
- Add up all notification appliance loads and record in the table at Line C.
- For notification appliances and auxiliary devices not mentioned in the manual, refer to the device manual for the current ratings.
- Make sure that the total alarm current you calculated, including current for the panel itself, does not exceed 6.0 A. This is the maximum alarm current allowable.
- Complete the remaining instructions in the table for determining battery size requirements.

#### Maximum Battery Standby Load

Table 2.3 shows the maximum battery standby load for the RPS-1000 based on 24 and 60 hours of standby. The standby load calculations of line G in the Current Draw Calculation Worksheet must be less than the number shown in Table 2.3 for the battery size used and standby hours required.

**Table 2.3 Maximum Battery Standby Load**

Rechargeable Battery Size	Max. Load for 24 hrs. Standby, 5 mins. Alarm	*Max. Load for 60 hrs. Standby, 5 mins. Alarm
7 AH	270 mA	105 mA
12 AH	475 mA	190 mA
17 AH	685 mA	270 mA
33 AH	1370 mA	540 mA

\* Required for NFPA 72 Auxiliary Protected Fire Alarm systems for Fire Alarm Service (City Box) and Remote Station Protected Fire Alarm systems (Polarity Reversal) and Digital Alarm Communicator/Transmitter (DACT).

*\*Use a separate worksheet for each RPS-1000*

**NOTE:** 33AH max battery size for Fm (Factory Mutual) installations

### 2.6.2 Current Draw Worksheet for IDP SLC Devices

For each RPS-1000\* in the installation, use this worksheet to determine current requirements during alarm/battery standby operation. See individual FACP manual for maximum number of devices.

**Table 2.4 Current Draw Worksheet for IDP SLC Devices**

Device	# of Devices	Current per Device		Standby Current	Alarm Current
For each device use this formula: This column X This column = Current per number of devices.					
RPS-1000 Intelligent Power Module (Current draw from battery)	1*	Standby	40 mA	40 mA	
		Alarm:	160 mA		160 mA
Additional RPS-1000 (Daisy-chained to this module)	(7 max.)	Standby	10 mA	mA	
		Alarm:	10 mA		mA

Table 2.4 Current Draw Worksheet for IDP SLC Devices

Device	# of Devices	Current per Device		Standby Current	Alarm Current
Addressable SLC Devices					
IDP-Photo		Standby: .30 mA <sup>1</sup>		mA	mA
IDP-Photo-T				mA	mA
IDP-PhotoR				mA	mA
IDP-Heat				mA	mA
IDP-Heat-HT				mA	mA
IDP-Acclimate		Standby: .30 mA <sup>1</sup>		mA	mA
IDP-Heat-ROR				mA	mA

I Multiply lines E and H.			Total alarm AH		AH
J Add lines G and I.			Total ampere hours required	AH	

\*\*If you are using door holders, you do not need to consider door holder current for alarm/battery standby, because power is removed

during that time. However, during normal operation, door holders draw current and must be included in the 6.0 A total current that can be drawn from the panel.

\*\*\*Use next size battery with capacity greater than required.

## 2.7 Wiring Specifications

### 2.7.1 Length Limitations

This section contains information on calculating SBUS wire distances and the types of wiring configurations (Class A and B).

### 2.7.2 Calculating Wiring distance for SBUS modules

The following instructions will guide you in determining the type of wire and the maximum wiring distance that can be used with SBUS accessory modules.

To calculate the wire gauge that must be used to connect SBUS modules to the panel, it is necessary to calculate the total worst case current draw for all modules on a single 4-conductor bus. The total worst case current draw is calculated by adding the individual worst case currents for each module. The individual worst case values are shown in the table below.

**NOTE:** Total worst case current draw on a single SBUS cannot exceed 1 amp. If a large number of accessory modules are required, and the worst case current draw will exceed the 1 amp limit, then the current draw must be distributed using RPS-1000 Power Expanders. Each RPS-1000 Power Expander provides an additional SBUS, with an additional 1 amp of SBUS current. Wiring distance calculations are done separately for each RPS-1000, and separately for the panel itself

Model Number	Worst Case Current Draw
Fire Annunciator	.120 amps
6815 SLC Loop Expander	.078 amps
5815XL SLC Loop Expander	.150 amps
5824 Serial/Parallel Printer Interface Module	.040 amps
5880 LED I/O Module	.250 amps
5865 LED Annunciator	.200 amps
Intelligent Power Supply	.010 amps
5496 NAC Expander	.010 amps
ECS-50W	.010 amps
ECS-125W	.010 amps
ECS-VCM / ECS-VCM with ECS-SW24*	.115 amps /.185 amps
ECS-NVCM Network Voice Control Module	.059 amps
ECS-EMG NVCM keypad	.06 amps
ECS-LOC	.210 amps /.325 amps
ECS-DUAL50W	.010 amps
ECS-DUAL50W WITH ECS-50WBU	.010 amps
SK-NIC Network Interface Card	.021 amps
CELL-MOD/CELL-CAB-SK	.145 amps
SK-F485C Fiber Converter	.125 amps

After calculating the total worst case current draw, Table 2.7 specifies the maximum distance the modules can be located from the panel on a single wire run. The table insures 6.0 volts of line drop maximum. In general, the wire length is limited by resistance, but for heavier wire gauges, capacitance is the limiting factor.

These cases are marked in the chart with an asterisk (\*). Maximum length can never be more than 6,000 feet, regardless of gauge used. (The formula used to generate this chart is shown in the note below).

**Table 2.7 Wire Distances Per Wire Gauge**

Wiring Distance: SBUS Modules to Panel				
Total Worst Case Current Draw (amps)	22 Gauge	18 Gauge	16 Gauge	14 Gauge
0.100	1852 ft.	4688 ft.	* 6000 ft.	* 6000 ft.
0.200	926 ft.	2344 ft.	3731 ft.	5906 ft.
0.300	617 ft.	1563 ft.	2488 ft.	3937 ft.
0.400	463 ft.	1172 ft.	1866 ft.	2953 ft.
0.500	370 ft.	938 ft.	1493 ft.	2362 ft.
0.600	309 ft.	781 ft.	1244 ft.	1969 ft.

**Table 2.7 Wire Distances Per Wire Gauge**

<b>Wiring Distance: SBUS Modules to Panel</b>				
<b>Total Worst Case Current Draw (amps)</b>	<b>22 Gauge</b>	<b>18 Gauge</b>	<b>16 Gauge</b>	<b>14 Gauge</b>
0.700	265 ft.	670 ft.	1066 ft.	1687 ft.
0.800	231 ft.	586 ft.	933 ft.	1476 ft.
0.900	206 ft.	521 ft.	829 ft.	1312 ft.
1.000 (Max)	185 ft.	469 ft.	746 ft.	1181 ft.

**NOTE:** The following formulas were used to generate the wire distance chart

$$\text{Maximum Resistance (Ohms)} = \frac{6.0 \text{ Volts}}{\text{Total Worst Case Current Draw (amps)}}$$

$$\text{Maximum Wire Length (Feet)} = \frac{\text{Maximum Resistance (Ohms)}}{\text{Rpu}} * 500$$

(6000 feet maximum)

where: Rpu = Ohms per 1000 feet for various Wire Gauges (see table below)

**Table 2.8 Typical Wire Resistance Per 1000 ft.**

<b>Wire Gauge</b>	<b>Ohms per 1000 feet (Rpu)</b>
22	16.2
18	6.4
16	4.02
14	2.54

#### ■ Wiring Distance calculation example:

Suppose a system is configured with the following SBUS modules:

- 2 - RA-1000 Fire Annunciator
- 1 - RPS-1000 Intelligent Power Expander
- 1 - 5865 LED Fire Annunciator
- 1 - 5824 Parallel/Serial Interface

The total worst case current is calculated as follows:

RA-1000 Current Draw	= 2 x .100 amps	= .200 amps
RPS-1000 Current Draw	= 1 x .010 amps	= .010 amps
5865 Current Draw	= 1 x .200 amps	= .200 amps
5824 Current Draw	= 1 x .040 amps	= .040 amps
Total Worst Case Current Draw		= .450 amps

Using this value, and referring to the Wiring Distance table, it can be found that the available options are:

- 370 feet maximum using 22 Gauge wire
- 938 feet maximum using 18 Gauge wire
- 1493 feet maximum using 16 Gauge wire
- 2362 feet maximum using 14 Gauge wire

### 2.7.3 Wire Routing

You must follow power-limited wiring techniques, which includes maintaining one-quarter inch spacing between power-limited and non-power-limited circuits and separating high and low voltage circuits.

**Figure 2.2 Wire Routing Example**

## Section 3: Hardware Installation

RPS-1000 installation involves the following steps:

- AC power (Section 3.1) and backup battery connection (Section 3.2).
- Physical connection from the FACP to the controlling RPS-1000 (see Section 3.3).
- Setting an ID for the RPS-1000 (Section 3.3.1).
- Physical connection of SBUS modules that will be powered by this RPS-1000 (Section 3.4).
- Physical connection of any outputs (conventional relays, notification appliances, auxiliary power modules, and so on) that will be powered by this RPS-1000. See Section 3.5.1 for notification appliance wiring information. Refer to the FACP Installation Manual for software configuration information and other information about installing outputs.

### 3.1 AC Power

At installation, connect the AC terminals to 120 VAC source as shown in Figure 3.1. It may be necessary for a professional electrician to make this connection.

The AC terminals are rated as 120 VAC, 50 or 60 Hz, 2.7 A (for the RPS-1000) or 240 VAC, 50 or 60 Hz, 1.4A (for the RPS-1000HV).

Figure 3.1 AC Power Connection

### 3.2 Battery Connection

The RPS-1000 battery charge capacity is 7.0 to 33.0 AH. Use 12V batteries of the same AH rating. Determine the correct AH rating as per your current load calculation (see Table 2.4, Table 2.5 or Table 2.6).

**NOTE:** When your backup batteries requirements use backup batteries that are too large to fit into the RPS-1000 cabinet. The AB-33 cabinet holds batteries up to the 33 AH size. (Refer to FACP Installation manual for AB-33 installation instructions.)

Wire batteries in series to produce a 24-volt equivalent. Do not parallel batteries to increase the AH rating.

Figure 3.2 Battery Connection

### 3.3 Connecting the RPS-1000 to the FACP

1. Connect the RPS-1000 to the appropriate SBUS. The RPS-1000 can be connected directly to the FACP or can be daisy-chained to another RPS-1000. Figure 3.3 and Figure 3.4 show both connections.
2. Use on-board DIP switch to assign an ID#. (See Section 3.3.1) Figure 2.1 shows the location of the DIP switches on the RPS-1000 board.
3. Configure the RPS-1000 module by adding it to the system (through JumpStart or manually). You can also assign a name to the module. These procedures are described in the FACP Installation Manuals. See table below.

ECS Series Model Number	FACP Installation Manual
IFP-2000ECS	151430-L8
IFP-1000ECS	151460
IFP-100ECS	151458
IFP-300ECS	LS10145-001SK-E
IFP-2100ECS	LS10143-001SK-E

Figure 3.3 Class B RPS-1000 Connection to FACP

Figure 3.4 Class A RPS-1000 Connection to FACP

### 3.3.1 Setting the Device ID

The actual number of SBUS devices used is limited by current draw and SBUS bandwidth usage. When installing RPS-1000, you must use the DIP switches on the module to assign an ID# to the module. Address zero is an invalid address and is not allowed. Figure 3.5 shows all possible DIP switch positions and their correlation to numerical ID.

ON 													
OFF 													
1 2 3 4 5 6													
	0		22		44								
	1		23		45								
	2		24		46								
	3		25		47								
	4		26		48								
	5		27		49								
	6		28		50								
	7		29		51								
	8		30		52								
	9		31		53								
	10		32		54								
	11		33		55

	21		43										

Figure 3.5 Possible Module Addresses

### 3.4 Connecting SBUS Modules to the RPS-1000

1. Connect SBUS modules to the RPS-1000 as shown in Figure 3.6 or Figure 3.7.
2. All SBUS modules must have an ID. Use the DIP switches on the module board to assign an ID number (1-31) to the module. This number identifies the module to the RPS-1000 and must be unique.

- Software configuration steps vary for each SBUS module. For more information, refer to the FACP installation manual in the section that discusses the type of module you are installing.

Figure 3.6 SBUS Class A Connection to RPS-1000

Figure 3.7 SBUS Class B Wiring to RPS-1000

## 3.5 Flexputs™ I/O Circuits

The six Flexput™ circuits are an innovative and versatile feature of the RPS-1000 panel. They can be used as: Class A or B notification circuits, Class A or B initiation circuits (either 2 or 4 wire detectors), or as auxiliary power (resettable, continuous, or door holder).

This section of the manual explains how to install conventional notification appliances and initiating devices to be used with the RPS-1000.

### 3.5.1 Conventional Notification Appliance

This sub-section of the manual explains how to install conventional notification appliances for Class A and Class B configurations.

### 3.5.2 Releasing Operations

Approved releasing solenoids are list in Table 3.1. Do not mix cross alarming zones with smoke verification zones. There must be at least two automatic detection devices in each protected space. Spacing must be reduced to 0.7 times the linear spacing in accordance with NFPA 72.

**Table 3.1 Approved Releasing Solenoids**

Manufacturer	Part Number	Rating	Current	Freq
Asco	T8210A107	24 VDC	3A max	0 Hz
	8210G207	24 VDC	3A max	0 Hz

#### Class B Notification Wiring

You must use an appliance from the list of compatible appliances in the Appendix A.

To install a Class B notification appliance circuit:

1. Wire Class B Notification appliances as shown in Figure 3.8.
2. Configure the circuit through programming.

**Figure 3.8 Class B Notification Appliance Circuit Wiring**

#### Class A Notification Wiring

You must use an appliance from the list of compatible appliances in the Appendix A at the back of this manual.

To install a Class A notification appliance circuit:

1. Wire the Class A notification appliances as shown in Figure 3.9.
2. Configure the circuit for Class A in programming (see the *FACP Installation manual*).

**Figure 3.9 Class A Notification Appliance Circuit Configuration**

**NOTE:** In programming any point that uses multiple I/O circuits are always referred to as the lowest I/O circuit number used. For example, Figure 3.9 uses both I/O circuit 5 and 6, so in programming it would be referred to as point 5

### 3.5.3 Conventional Initiation Circuits

This section of the manual explains how to install conventional initiating devices for Class A (Style D) or Class B (Style B) configurations.

#### Class B Inputs

You can connect conventional Class B switches, such as waterflow switches and pull stations, directly to the I/O circuits of the RPS-1000 panel.

To install a Class B switch:

1. Wire the Class B switch as shown in Figure 3.10.
2. Configure the circuit through programming (see *FACP Installation manual*).

Figure 3.10 Class B Input Switches

#### Class A Inputs

You can connect conventional Class A switches, such as waterflow switches and pull stations, directly to the I/O circuits of the RPS-1000 panel.

To install a Class A switch:

1. Wire the Class A switch as shown in Figure 3.11.
2. Configure the circuit through programming (see *FACP Installation manual*).

Figure 3.11 Class A initiating Switches

**NOTE:** In programming any point that uses multiple I/O circuits are always referred to as the lowest I/O circuit number used. For example, Figure 3.11 uses both I/O circuit 5 and 6, so in programming it would be referred to as point 5

Model Number	FACP Installation Manual
IFP-2000ECS	151430-L8
IFP-1000ECS	151460
IFP-100ECS	151458
IFP-300ECS	LS10145-001SK-E
IFP-2100ECS	LS10143-001SK-E

### 3.5.4 Installing 2-Wire Smoke Detectors

Any compatible UL listed two-wire smoke detector can be used with the RPS-1000 panel (see “Compatible Devices” on page 1 for list of compatible smoke detectors). Figure 3.12 and Figure 3.13 illustrate how to connect a UL listed 2-wire detector to the control panel.

#### ■ Class B Installation

To install a Class B two-wire smoke detector, wire as shown in Figure 3.12.

Figure 3.12 Two-Wire Class B Smoke Detector

#### ■ 2-Wire Class A Smoke Detector Installation

To install a Class A two-wire smoke detector, wire as shown in Figure 3.13.

Figure 3.13 Two-Wire Class A Smoke Detector Connections

**NOTE:** In programming any point that uses multiple I/O circuits are always referred to as the lowest I/O circuit number used. For example, Figure 3.13 uses both I/O circuit 5 and 6, so in programming it would be referred to as point 5.

### 3.5.5 Installing 4-Wire Smoke Detectors

Any compatible UL listed four-wire smoke detector can be used with the RPS-1000 panel (see Appendix A for list of compatible smoke detectors). Figure 3.12 and Figure 3.13 illustrate how to connect a UL listed four-wire detector to the control panel.

#### ■ Installing a Class B 4-Wire Smoke Detector

Figure 3.14 illustrates how to install a 4-wire Class B smoke detector.

Conventions used for wiring 4-wire Class B loops:

1. Up to three Class B 4-wire smoke detector loops can be connected to the control panel at once.
2. Each Class B loop input is paired with a unique power source as shown in Figure 3.14.
3. Each loop gets smoke power from the even numbered I/O circuit and the contact input is connected to the odd numbered I/O circuit.

Figure 3.14 Class B 4-Wire Smoke Detector Connections

**NOTE:** In programming any point that uses multiple I/O circuits are always referred to as the lowest I/O circuit number used. For example, "Class B 4-Wire Smoke Detector Connections" on page 29 uses both I/O circuit 5 and 6, so in programming it would be referred to as point 5.

#### ■ Installing 4-Wire Class A Smoke Detectors

Figure 3.15 illustrates how to install 4-wire Class A detectors.

Conventions used for wiring 4-wire Class A loops:

1. Up to two Class A 4-wire smoke detectors can be connected to the control panel at once.

2. Smoke power is supplied to each Class A loop as shown in Figure 3.15.

Figure 3.15 Class A 4-Wire Smoke Detector Connections

**NOTE:** In programming any point that uses multiple I/O circuits are always referred to as the lowest I/O circuit number used. For example, Figure 3.15 uses I/O circuits 1, 2, 3 together and 4, 5, 6 together. In programming (1, 2, 3) would be referred to as point 1, and (4, 5, 6) would be referred to as point 4.

### 3.5.6 Auxiliary Power Configuration

Flexput circuits 1-6 on the control panel can be used as auxiliary power circuits. The three types of auxiliary power available are:

- Door Holder (see Section for description)
- Constant (see Section for description)
- Resettable (see Section for description)
- Sounder Sync Power (see Section for description)

Auxiliary power circuits are power limited. Each circuit can source up to 3A (total current for all Flexput circuits must not exceed 5A).

To configure a Flexput circuit as auxiliary power:

1. Wire the Flexput circuit(s) that will be used for auxiliary power. See Figure 3.16 for location of Flexput circuits.
2. Configure the auxiliary power output through programming for Door Holder, Constant or Resettable power.

When used as auxiliary power; terminals labeled "0" are negative, terminals labeled "X" are positive.

Figure 3.16 Flexput Circuits Used as Auxiliary Power

#### Door Holder Power

Door holder is intended for fire door applications. When there are no alarms in the system and the panel has AC power, door holder circuits have 24-volt power present at their terminals. Any alarm will cause power to discontinue. Power will be re-applied when the system is reset. If AC power is off for more than 15 seconds the auxiliary door holder power will be discontinued to conserve the battery backup power. When AC power is restored, power is immediately restored to the door holder circuits.

### Constant Power

Use constant power for applications that require a constant auxiliary power source. Power is always present at Constant circuits.

### Resettable Power

Resettable power is typically used to power beam detectors, flame detectors, and conventional 4-wire smoke detectors. For circuits selected as Resettable, 24-volt power is always present at the terminals unless a system reset occurs. If a system reset occurs, power is removed from the terminals for 30 seconds, then re-applied.

### Sounder Sync Power

Sounder Sync Power continuously outputs the System Sensor synchronization pattern and is intended for use with B200S sounder bases.

## 3.6 Conventional Relay Installation

RPS-1000 relay circuits are installed in exactly the same way as FACP main panel relay circuits. For ease of installation, the RPS-1000 output terminals use the same numbering scheme as the FACP terminals. Refer to below listed FACP manual for information on installing conventional relays.

Model Number	FACP Installation Manual
IFP-2000ECS	151430-L8
IFP-1000ECS	151460
IFP-100ECS	151458
IFP-300ECS	LS10145-001SK-E
IFP-2100ECS	LS10143-001SK-E

# Appendix A

## Compatible Devices

### A.1 Notification Appliances

For proper operation, you must use polarized devices with a 4.7k ohm EOL resistor on each loop. All supervised notification appliances used with the control panel must be polarized.

**NOTE:** Not all devices can use the Sync feature, be sure to check table below to ensure the device you have chosen will work with this feature. This control is UL listed for panel wide Synchronization.

Table below lists notification appliances compatible with the fire alarm control panel. Appliances which can be synchronized indicate the type of SYNC available in the columns marked Audio and Visual.

## A.2 Two Wire Detectors

Table A-1 lists two-wire smoke detectors that are compatible with the fire control panel. The table is organized by manufacturer. The columns show the number of detectors per loop that can be used..

	<b>RPS-1000</b>
<b>Identifier</b>	24H
<b>Operating voltage Range</b>	17.5-27.4 VDC

**NOTE:** The maximum number of smoke detectors per zone is determined by both the current draw and the impedance of the smoke detector. If too many smoke detectors are used on any zone, false alarms could occur.

**NOTE:** Do not mix different models of detectors on any zone; false alarms could occur.

**NOTE:** Control unit Smoke Reset Time must be programmed for a number greater than or equal to the maximum reset time of the smoke detector.

**Table A-1 Compatible Two-Wire Smoke Detectors Style B**

Manufacturer	Model Name or Number (Base model name or number in parenthesis.)	Compatibility ID		# per Loop
		Head	Base	
Apollo	55000-350 (45681-200)	55000-350	45681-200	15 / loop

Model Number	Description
B200S-LF	Low Frequency Intelligent Sounder Base
B200SR-LF	Low Frequency Intelligent Sounder Base

---

# Honeywell Fire Product Warranty and Return Policy

---

## General Terms and Conditions

- All new fire products manufactured by Honeywell have a limited warranty period of 36 months from the date of manufacture against defects in materials and workmanship. See limited warranty statement for details.
- This limited warranty does not apply to those products that are damaged due to misuse, abuse, negligence, exposure to adverse environmental conditions, or have been modified in any manner whatsoever.

## Repair and RMA Procedure

- All products that are returned to Honeywell for credit or repair require a RMA (Return Authorization) number. Call Customer Service at 800-328-0103 or 203-484-7161 between 8:00 A.M. and 5:00 P.M. EST, Monday through Friday to obtain a return authorization number.
- Honeywell Farenhyt Series Technical Support is available at 800-446-6444 between 8:00 A.M. and 5:00 P.M. CST, Monday through Friday.
- All returns for credit are subject to inspection and testing at the factory before actual determination is made to allow credit.
- RMA number must be prominently displayed on the outside of the shipping box. See return address example under Advanced Replacement Policy.
- Included with each return should be: a packing slip that has the RMA number, a content list, and a detailed description of the problem.
- All products returned by Honeywell must be sent freight pre-paid. After the product is processed, Honeywell will pay for shipping product back to customer via UPS ground.
- Return the Honeywell product circuit board only. Products that are returned in cabinets will be charged an additional \$50 to cover the extra shipping and handling costs over board only returns. **Do not return batteries.** Honeywell has the authority to determine if a product is repairable. Products that are deemed un-repairable will be returned to the customer.
- Product that is returned that has a board date code more than 36 months from date of manufacture will be repaired and the customer will be assessed the standard Honeywell repair charge for that model.

## Advanced Replacement Policy

- Honeywell Farenhyt Series offers an option of advance replacement for fire product printed circuit boards that fail during the first 6 months of the warranty period. These items must be returned with transportation charges prepaid and must be accompanied by a return authorization.
- For advance replacement of a defective board, contact your local Honeywell distributor or call Honeywell at 800-328-0103 to obtain a RMA (Return Authorization) number and request advanced replacement.
- A new or refurbished board will be shipped to the customer. The customer will initially be billed for the replacement board but a credit will be issued after the repairable board is received at Honeywell. All returned products must comply with the guidelines described under “General Terms and Conditions” and “Repair and RMA Procedure”.
- The defective board must be returned within 30 days of shipment of replacement board for customer to receive credit. No credit will be issued if the returned board was damaged due to misuse or abuse.

- Repairs and returns should be sent to:  
Honeywell Fire Systems  
Attn: Repair Department / RA Number \_\_\_\_\_  
12 Clintonville Road  
Northford, CT 06472 USA

---

## Manufacturer Warranties and Limitation of Liability

---

**Manufacturer Warranties.** Subject to the limitations set forth herein, Manufacturer warrants that the Products manufactured by it in its Northford, Connecticut facility and sold by it to its authorized Distributors shall be free, under normal use and service, from defects in material and workmanship for a period of thirty six months (36) months from the date of manufacture (effective Jan. 1, 2009). The Products manufactured and sold by Manufacturer are date stamped at the time of production. Manufacturer does not warrant Products that are not manufactured by it in its Northford, Connecticut facility but assigns to its Distributor, to extent possible, any warranty offered by the manufacturer of such product. This warranty shall be void if a Product is altered, service repaired by anyone other than Manufacturer or its authorized Distributors. This warranty shall also be void if there is a failure to maintain the Products and the systems in which they operate in proper working conditions.

MANUFACTURER MAKES NO FURTHER WARRANTIES, AND DISCLAIMS ANY AND ALL OTHER WARRANTIES, EITHER EXPRESSED OR IMPLIED, WITH RESPECT TO THE PRODUCTS, TRADEMARKS, PROGRAMS AND SERVICES RENDERED BY MANUFACTURER INCLUDING WITHOUT LIMITATION, INFRINGEMENT, TITLE, MERCHANTABILITY, OR FITNESS FOR ANY PARTICULAR PURPOSE. MANUFACTURER SHALL NOT BE LIABLE FOR ANY PERSONAL INJURY OR DEATH WHICH MAY ARISE IN THE COURSE OF, OR AS A RESULT OF, PERSONAL, COMMERCIAL OR INDUSTRIAL USES OF ITS PRODUCTS.

This document constitutes the only warranty made by Manufacturer with respect to its products and replaces all previous warranties and is the only warranty made by Manufacturer. No increase or alteration, written or verbal, of the obligation of this warranty is authorized. Manufacturer does not represent that its products will prevent any loss by fire or otherwise.

**Warranty Claims.** Manufacturer shall replace or repair, at Manufacturer's discretion, each part returned by its authorized Distributor and acknowledged by Manufacturer to be defective, provided that such part shall have been returned to Manufacturer with all charges prepaid and the authorized Distributor has completed Manufacturer's Return Material Authorization form. The replacement part shall come from Manufacturer's stock and may be new or refurbished. THE FOREGOING IS DISTRIBUTOR'S SOLE AND EXCLUSIVE REMEDY IN THE EVENT OF A WARRANTY CLAIM.
